IN THE CLAIMS AMEND

56C11 1. A covering arrangement for a building, the arrangement having parallel elongate supports and, arranged on the supports, covering parts which

- a) comprise a core and, connected thereto, upper and lower planar covering elements in the manner of a sandwich,
- b) have an elongate, striplike form,
- c) in the installed positing are arranged transversely to the supports and extend at least from one support to a neighbouring support,

B' wherein

- d) a longitudinal border region (30) of a covering part (16) has a connecting device (68) and the opposite longitudinal border region (34) of a neighbouring covering part (16) has a connecting device (70) complementary thereto, by means of which the two covering parts (16) are firmly connected to each other;
- e) the connecting devices (68, 70) comprise at least one catch projection (78) and a catch recess (72, 74, 76) complementary thereto; such that
- f) the relative position of the covering part (16) with respect to a neighbouring covering part (16) can be varied.

56C11 3. A covering part for use in a covering arrangement as claimed in claim 1, which

- B2*
- a) comprises a core and, connected thereto, upper and lower planar covering elements in the manner of a sandwich, and

b) has an elongate, striplike form,
wherein

c) one longitudinal border region (30) has a connecting device (68) and the opposite longitudinal border region (34) has a connecting device (70) complementary thereto, such that the covering part (16) can be firmly connected to an identical covering part (16) at, in the installed position, mutually facing longitudinal border regions (30, 34).

ant
C

5. A covering part as claimed in claim 2, wherein the two connecting devices (68, 70) in the installed position cooperate in the manner of a hinge, the pivot axis running substantially parallel to the longitudinal axis of the covering part (16).

6. A covering part as claimed in claim 2, wherein at least one of the connecting devices (68, 70) is integrated into a stiffening member (32, 36) arranged in the region of the corresponding longitudinal border region (30, 34) of said covering part.

7. A covering part as claimed in claim 2, wherein the connecting devices (68, 70) each extend over its entire length.

8. A covering part as claimed in claim 2, wherein the connecting devices (68, 70) are designed in such a way that, in the installed position, the mutually facing longitudinal border regions (30, 34) of neighbouring covering parts (16) at least regionally overlap.
